Setting up the environment

Vinh The Nguyen

Computer Science, Texas Tech University

Setting up the environment

In this exercise, we are going to run the rootkit: WindowsRegistryRootkit with the given link address: https://github.com/Cr4sh/WindowsRegistryRootkit

This rootkit will exploit the vulnerability of the win32k.sys on the 32bit OS. That is, hiding the shellcode in Registry value, and employs the function win32k!bInitializeEUDC() to get execution when Window startup.

This rootkit will be run on Windows7 SP1 32bit (it does not work with 64 bit). We setup a clean windows 7 trial version. We install Chrome browser only.

Purpose of the study:

In this study, I try to locate the shellcode hiding in the Registry.

Existing approach

I've tried multiple approach with Linux but none of them get succeeded. The hardest problem is reading the memory dump file in Linux. I followed a lot of approaches on the internet. The most complete one is: https://www.jamesbower.com/linux-memory-analysis/ which have the following important steps.

1) We'll first make sure our Ubuntu 16.04 Server box is completely upgraded.

2) Next we will install the proper dependencies for both LiME and Volatility.

3) We'll install and configure LiME.

4) Then we'll install and configure Volatility.

5) Finally, we'll create a test memory dump for the memory analysis. And use it to test that Volatility is working.

I've tried different version of Linux, but none of them worked.

```
vjnh@vjnh-VirtualBox:~/volatility$ sudo python vol.py -f test.lime --profile=Li
nuxUbuntu1604x64 linux_pslist
Volatility Foundation Volatility Framework 2.6
Offset             Name                 Pid             PPid            Uid
        Gid    DTB                Start Time
------------------ -------------------- -------------- -------------- -------
-------- ------ ------------------ ----------
No suitable address space mapping found
Tried to open image as:
 MachOAddressSpace: mac: need base
 LimeAddressSpace: lime: need base
 WindowsHiberFileSpace32: No base Address Space
 WindowsCrashDumpSpace64BitMap: No base Address Space
 WindowsCrashDumpSpace64: No base Address Space
 HPAKAddressSpace: No base Address Space
```

Current Approach ended up with setting up Windows in virtual machine and run a rootkit inside that environment. Dump the memory file and use volatility to analyze that file.

Procedure for memory acquisition.

1. Download Windows 7 SP1 from Microsoft page. Trial version expire in 30 days. Set default memory size to 8GB to speed up the installation.
2. After setting up the Windows 7, we install Chrome. Download the **DumpIt** and the rootkit **WindowRegistryRootkit**.
3. Shutdown Windows 7, set the memory RAM to 1Gb. At this time, we don't need to much RAM for the system, so 1Gb is reasonable.
4. Run the Rootkit, dump the memory file, and copy this memory file to the host folder.

Analyzing process.

There are two approaches to analyze the window memory file. If we use Windows as the main operating system, we can use Volatility for Windows at this link below

http://www.volatilityfoundation.org/24

If we use Linux, we can get volatility at: https://github.com/volatilityfoundation/volatility

In this report, I used Volatility for Window, this picture below shows the screenshot of the first command. The recommend profiles are Win7SP0x86 and Win7SP1x86.

```
C:\Users\iDVLab\Documents\vol>volatility-2.5.standalone.exe -f Win7.raw imageinfo
Volatility Foundation Volatility Framework 2.5
INFO    : volatility.debug    : Determining profile based on KDBG search...

```

The first one (as we usually select) is not always true. Since, I know that my OS is Win7SP1x86, so my command will be shown in Figure below.

```
C:\Users\iDVLab\Documents\vol>volatility-2.5.standalone.exe -f May4.raw --profile=Win7SP1x86 pslist

[+] SUCCESS
[+] Adding malicious data for value "Software\Microsoft\Windows NT\CurrentVersio
n\FontLink\FontLinkDefaultChar"...
[+] SUCCESS
************************************************
```

From this log file, we have some information such as

Shellcode is saved to “System\CurrentControlSet\Control\Configuration Data”

Rootkit image is saved to “System\CurrentControlSet\Control\PCI”…

And Malicious data for value is saved in “Software\Microsoft\Windows NT\CurrentVersion\FontLink\FontLinkDefaultChar”

We could go further by investing Registry.

First, let’s see what is current registry saved in memory by using hivelist

```
C:\Users\iDVLab\Documents\vol>volatility-2.5.standalone.exe -f May4.raw --profile=Win7SP1x86 hivelist
Volatility Foundation Volatility Framework 2.5
Virtual    Physical   Name
---------- ---------- ----
0x8900c800 0x25a6a800 [no name]
0x8901a4c8 0x2592c4c8 \REGISTRY\MACHINE\SYSTEM
0x89042008 0x343d9008 \REGISTRY\MACHINE\HARDWARE
0x890bc9c8 0x183049c8 \SystemRoot\System32\Config\DEFAULT
0x89612008 0x0ae5f008 \SystemRoot\System32\Config\SECURITY

0x896a49c8 0x1b5de9c8 \SystemRoot\System32\Config\SAM
0x89760500 0x2e1f2500 \??\C:\Windows\ServiceProfiles\LocalService\NTUSER.DAT
0x8e8999c8 0x1d9d49c8 \??\C:\Windows\System32\config\COMPONENTS
0x8f073008 0x1cb1e008 \Device\HarddiskVolume1\Boot\BCD
0x8f0739c8 0x1cb1e9c8 \SystemRoot\System32\Config\SOFTWARE
0x921bb380 0x17345380 \??\C:\System Volume Information\Syscache.hve
0x922619c8 0x15e529c8 \??\C:\Users\iDVLab\AppData\Local\Microsoft\Windows\UsrClass.dat
0x923219c8 0x204fe9c8 \??\C:\Users\iDVLab\ntuser.dat
0xb698e9c8 0x0a8149c8 \??\C:\Windows\System32\SMI\Store\Machine\SCHEMA.DAT
```

Not much information I can find from here. So I dump the Registry into files with command “registrydump”. It gives me a list of registry files.

```
C:\Users\iDVLab\Documents\vol>volatility-2.5.standalone.exe -f May4.raw --profile=Win7SP1x86 dumpregistry -D dump/
```

registry.0x8e8999c8.COMPONENTS.reg	5/4/2018 6:55 PM	Registration Entries	29,960 KB

Open the registry and find the path based on the consoles log, I found interesting values

```
[HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control]

```

This data is in Hex value, we need to convert them into ASCII. I found the shellcode

```
[HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control]
"PreshutdownOrder"=[REG_MULTI_SZ] wuauserv gpsvc trustedinstaller
"WaitToKillServiceTimeout"="12000"

```

We can see that the shellcode is attached to winlogon.exe, upon start next time, this shellcode will run. END!
